EXPERIMENT 5: EXPERIMENTS ON PACKET CAPTURE TOOL – WIRESHARK

AIM

To capture and analyze network packets using the Wireshark packet capture tool.

DESCRIPTION

Wireshark is a network protocol analyzer used to capture and analyze network traffic. It displays packet details such as source IP address, destination IP address, protocol type, packet length, and other information. It helps understand network communication and troubleshoot network problems.

PACKET CAPTURE

1. Open Wireshark and select the active network interface.
2. Click Start to begin capturing packets.
3. Generate network traffic by browsing a website or using the ping command.
4. Observe the captured packets in the packet list.
5. Select a packet to view its detailed protocol information.
6. Apply filters such as `tcp`, `dns`, or `icmp` to view specific packets.
7. Stop the capture and save the packets if required.

OBSERVATION

The captured packets were displayed with their time, source address, destination address, protocol, length, and information. Different protocols such as TCP, DNS, and ICMP were observed and analyzed using display filters.

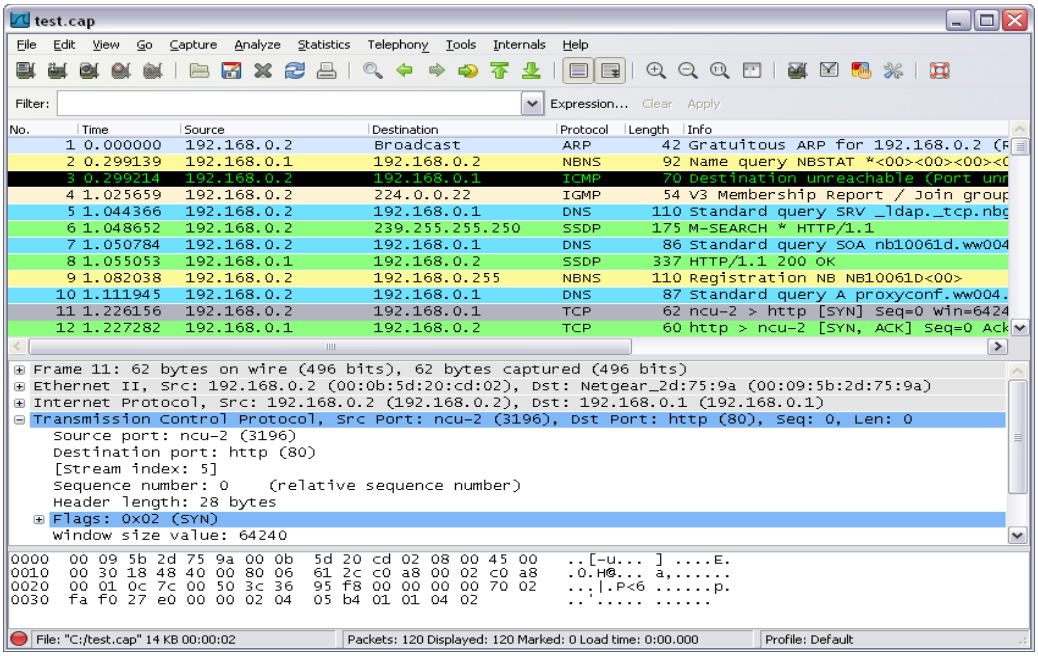

OUTCOME

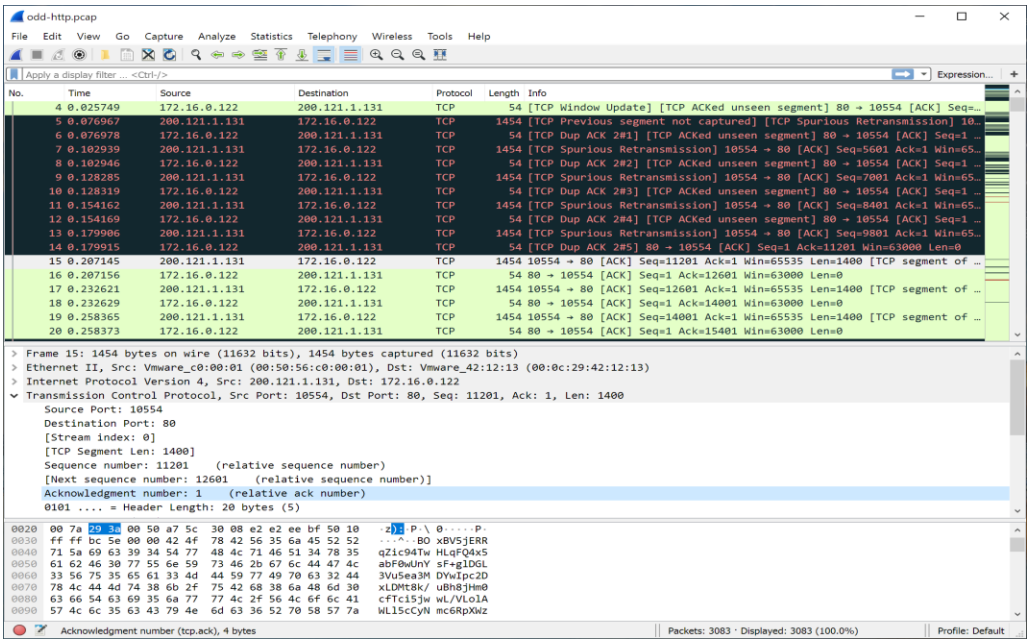

Network packets were successfully captured and analyzed using Wireshark. The packet details and protocols involved in network communication were studied.

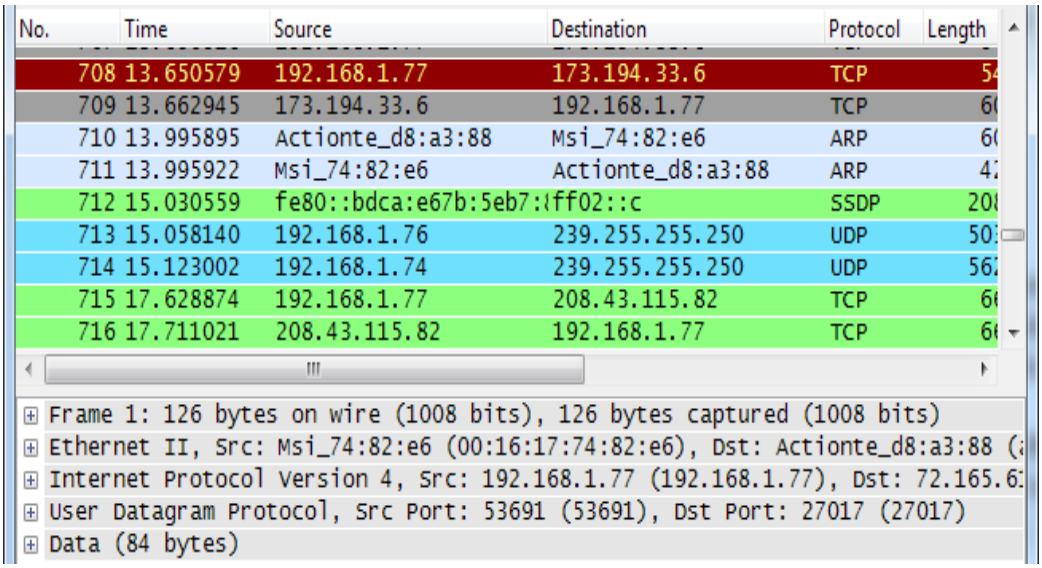

CHALLENGES FACED

1. Identifying the correct network interface for packet capture.
2. Understanding the different protocols displayed in the packet list.
3. Applying the correct display filters to analyze specific packets.

SCREENSHOTS

RESULT

The experiment was completed successfully, and network packet capture and analysis using Wireshark were performed.
